

What Is Coccidiosis?

Coccidiosis is caused by infection of protozoan parasites, which attack the lining of the digestive track. Infections have the following effect on calves;

- Loss of absorption capacity in the gut
- Diarrhoea
- Weight loss and poor weight gains
- Most often seen in calves at 1-3 months of age and older

EIMERICOX (EMX)

EMX is a combination of plant extracts and essential oils that improve calf performance through maintaining gut integrity and help manage coccidian by having a toxic effect on the oocysts that are shed when a cocci infection is present.

- The essential oils create local oxidative stress within the gut which impairs the membranes of protozoa. EMX offers a protective effect on the Intestinal wall which results in a reduction in diarrhoea and clinical symptoms in conjunction with an improvement in calf growth
- Plant extracts have an anti-inflammatory effect and thus support good blood flow in the gut

Trials

Work carried out using EMX indicate that it has almost entirely prevents infection of coccidia (61-95 % efficient) by oral supplementation during the feeding period from milk till weaning.

Application

EMX is added to our Calf Starter Pellets, supplementing the calf when it is most at risk of coccidiosis in the first 3 months of life.

Health Pack

Calf Starter Pellets also contain Safmannan (yeast cell wall extracts), Selplex and elevated levels of vitamin E to boost the calves immune system at a critical time.
